

PlayChip Top up Program

PlayChips™ from Denbow.
Safe, Certified, Trusted.

Denbow's top up program is IPEMA® certified for safety, and cost effective for your budget. Solutions are Denbow's specialty.

Not only has Denbow manufactured and supplied our tested, certified wood fibre playground PlayChips for many years, we also operate the largest fleet of Express Blower Trucks in the province. With this combination, we have proven we are able to meet the ongoing demands of schools and municipalities throughout BC, while offering direct-from-the-source pricing.

How does the PlayChip Top-Up Program work?

You provide us with a list of playgrounds that require material or your budget for top-ups. We will:

- calculate quantity required and provide you with a quote to top-up all the areas
- supply and install certified Denbow PlayChips with blower trucks
- pass the savings of multiple sites in one mobilization on to you!

The Mission School District needed a reliable source of safe playground material, along with the option of blower installation into our playgrounds. Denbow has given us great results with their product and service! Jared and other staff have been very friendly and professional. It is a challenge at times working around the school schedules and Denbow has been flexible and cooperative with us. I would recommend Denbow to others for quality material supplied or installed.

Did you know?

Across Canada, **28,500 children** are treated every year for playground injuries, and three-quarters of those incidents result from children **falling onto inadequate play surfaces** that fail to buffer their falls. Processed specifically for playground surfacing, Denbow PlayChips knit together to provide a softer landing for playground falls. Denbow uses top quality pulp grade chips to make the highest quality Playchip.

! Denbow certified PlayChips are manufactured with whitewood from BC sawmills. They are **certified**, meeting ASTM 1294 standards with IPEMA Certification

Remember

Regularly monitor the condition of the playground surfacing (generally every 4-6 months) to ensure it still provides children with the fall protection they need. Proper depth is 12" after compaction. Occasional raking will keep the material looking fresh all year-round, and will maximize its fall attenuation properties.
